

# **EEG Insights: Enhancing Brain Signal Monitoring through Advanced Computer Vision and Pattern Recognition**

Potential Faculty Advisors: Dr Yapeng Tian, Dr Yu Xiang, Dr Xiaohu Guo

## Research Question

*How can computer vision and pattern recognition techniques be optimized to improve the interpretation and accuracy of EEG recordings for patients with epilepsy and other neurological disorders?*

## Summary

The aim of this research is to utilize computer vision and pattern recognition techniques to enhance the analysis of EEG recordings for patients with epilepsy and other neurological disorders. By developing advanced models, we aim to improve the detection and interpretation of abnormal EEG patterns, which are critical for the diagnosis and management of epilepsy and stroke. This project is motivated by the personal experience of living with epilepsy, providing an added incentive to explore innovative solutions that can significantly impact patient care and daily life management.

The research focuses on leveraging state-of-the-art technologies, including convolutional neural networks (CNNs) and transformers, to analyze EEG signals more accurately and efficiently. Given the reliance of epilepsy and stroke patients on EEG recordings for evaluating their condition, our goal is to create a robust system that can assist healthcare providers in making more informed decisions. This research is highly relevant to current advancements in medical imaging and neurological studies, aiming to bridge gaps in existing diagnostic tools and contribute to the betterment of patient outcomes.

## Methodology

- Data Collection and Preprocessing:
  - Gather EEG datasets from sources like Kaggle, EEGCVPR40, and Thoughtviz.
  - Clean and preprocess the data to ensure it is suitable for model training.
- Model Development:
  - Utilize computer vision techniques to extract features from EEG recordings.
  - Develop convolutional neural networks (CNNs) and transformer models to analyze the EEG patterns.
  - Train initial simple models to build a foundational understanding before progressing to more complex architectures.
- Training and Validation:
  - Split the datasets into training, validation, and test sets.

- Train the models using GPU resources for faster processing.
- Validate the models' performance using standard metrics such as accuracy, precision, recall, and F1-score.

- Research Collaboration and Ideation:

- Engage with team members to dissect and analyze relevant research papers.
- Encourage novel ideas and approaches for improving model performance.
- Motivate the team towards potential publication of findings.

- Implementation and Evaluation:

- Implement the models in a real-world scenario to test practical applicability.
- Continuously evaluate and optimize the models based on performance and feedback.

### Resources Needed

- Lab Computer: Necessary for handling large datasets and training models with significant batch sizes and epochs.
- Nvidia GPU or Similar: Essential for faster model training due to the computationally intensive nature of deep learning.
- Professor's Guidance: Valuable for obtaining expert advice, feedback, and direction throughout the research project.

### Annotated Bibliography

1. Paper Title: "Learning Robust Deep Visual Representations from EEG Brain Recordings"

- Authors: Prajwal Singh, Dwip Dalal, Gautam Vashishtha, Krishna Miyapuram, Shanmuganathan Raman

- Description: This paper explores the development of deep learning models for analyzing EEG brain recordings. The authors demonstrate how robust visual representations can be learned from EEG data, highlighting the potential of CNNs and other deep learning techniques. The study's findings show significant improvements in EEG signal interpretation, providing a solid foundation for further research in this area.

- Evaluation: The methodologies and results presented in this paper offer valuable insights into the application of deep learning for EEG analysis, making it a critical resource for our project.

2. Paper Title: "Automated Epileptic Seizure Detection Using Deep Learning: A Review"

- Source: IEEE Access

- Description: This review paper provides an overview of various deep learning techniques used for automated seizure detection in EEG data. It discusses the performance of different models and highlights the challenges and opportunities in this field. The comprehensive review serves as a guide for understanding current advancements and identifying areas for improvement.

- Evaluation: The paper's in-depth analysis of existing models and techniques will help inform our approach to developing more accurate and reliable seizure detection systems.

### 3. Paper Title: "Deep Learning for Automated Epileptic Seizure Detection Using EEG Signals"

- Source: IEEE Transactions on Neural Systems and Rehabilitation Engineering
- Description: This study explores the application of CNNs for detecting epileptic seizures from EEG signals. The researchers achieved high accuracy and demonstrated the model's potential in clinical settings. The paper provides detailed methodologies and results, offering a valuable reference for developing similar models.
- Evaluation: The successful implementation of CNNs in this study provides a practical example of how deep learning can enhance EEG analysis, supporting our research objectives.

### 4. Paper Title: "A Comprehensive Review on Video-Based Epileptic Seizure Detection Using Deep Learning Approaches"

- Source: Journal of Biomedical Informatics
- Description: This review discusses the use of video-based methods for detecting epileptic seizures, emphasizing the effectiveness of deep learning techniques. Although focused on video data, the insights and techniques discussed are applicable to EEG data analysis as well.
- Evaluation: The paper's exploration of deep learning approaches for seizure detection offers valuable perspectives and techniques that can be adapted for EEG analysis.

### 5. Paper Title: "Real-Time Epileptic Seizure Detection in Scalp EEG Signals Based on Multiview Deep Learning"

- Source: IEEE Journal of Biomedical and Health Informatics
- Description: The authors propose a multiview deep learning approach for real-time seizure detection using EEG signals. The study achieves high sensitivity and specificity, indicating the potential for real-world applications. The paper's methodologies and results are relevant to our goal of developing an accurate and efficient seizure detection system.
- Evaluation: This paper's focus on real-time detection and multiview deep learning provides innovative ideas and methodologies that can be incorporated into our research.
